

# 彰化縣電腦商業同業公會 iPhone App 應用程式設計進階班

2013/06/08~2013/06/22

通知與推播服務

# 通知與推播服務

- 通知 Notification

目的都是讓 App 在背景執行時，可以提醒使用者，某些訊息或是某些事件

- 本機通知(本地) Local Notifications

透過排程在同一部設備裡分派

- 推播通知(遠端) Push Notifications

透過你自己設立的主機傳達到 Apple 的推播通知主機，再送達指定的設備

- 通知中心 Notification Center  
(NSNotificationCenter Class)

目的在提供程式內的廣播資訊機制

# 通知與推播服務

- 對使用者來說，兩者看起來像是一樣
  - 顯示 Alert 「提示」與 Banner 「橫幅」
  - App 的 Badge 「標記圖像」
  - 播放提示聲

# 通知與推播服務

- 然而實際上對 App 運作來講是不同的。

- App 執行時，AppDelegate

[application:didReceiveRemoteNotification:](#)

[application:didReceiveLocalNotification:](#)

- App 背景時，AppDelegate

[application:didFinishLaunchingWithOptions:](#) 的 Key

[UIApplicationLaunchOptionsLocalNotificationKey](#)

[UIApplicationLaunchOptionsRemoteNotificationKey](#)

參考「Local and Push Notification Programming Guide」之  
「Scheduling, Registering, and Handling Notifications」

# Local Notifications

# Local Notifications

- UILocalNotification
  - Scheduled time: (fire date)
  - Notification type: alert message, action button, badge number, sound to play
  - Custom data: dictionary

# UILocalNotification

## 建立 UILocalNotification

```
UILocalNotification *localNotif = [[UILocalNotification alloc] init];
```

## @property

```
fireDate, timeZone, alertBody, alertAction,  
soundName = UILocalNotificationDefaultSoundName  
applicationIconBadgeNumber, userInfo
```

## 通知排程

```
[[UIApplication sharedApplication] scheduleLocalNotification:localNotif];
```

## 取得排程中的通知

```
NSArray *notificationArray = [[UIApplication sharedApplication]  
scheduledLocalNotifications];  
UILocalNotification *notif = [notificationArray objectAtIndex:(0..n) ];
```

## 使用者從提醒小視窗按下，需在 AppDelegate.m 加上

```
– (void)application:(UIApplication *)application didReceiveLocalNotification:  
(UILocalNotification *)notif { ... }
```

# Push Notifications

# Push Notifications

## 使用時機

- 通常應用在需要主機資料交換的架構。
- 手機沒有與主機連線、在背景執行時。
- 主機端有新的資料發生，需要更新到手機。

## 優點

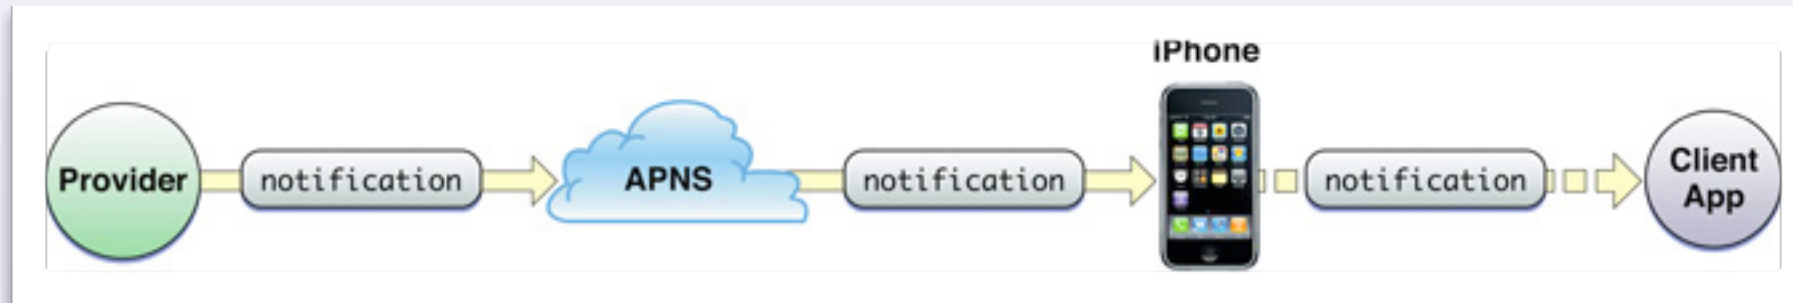

- 不用保持連線。
- 節省手機資源。

# Push Notifications

- Apple Push Notification service (APNs) 為中心
- 所有設備需要到 APNs 註冊，取得 device token
- device token 需要儲存於 provider server
- provider server 與 APNs 需要加密認證，建立固定管道
- provider server 傳送給 APNs 的訊息：  
device token 與 payload

# Push Notification 路徑

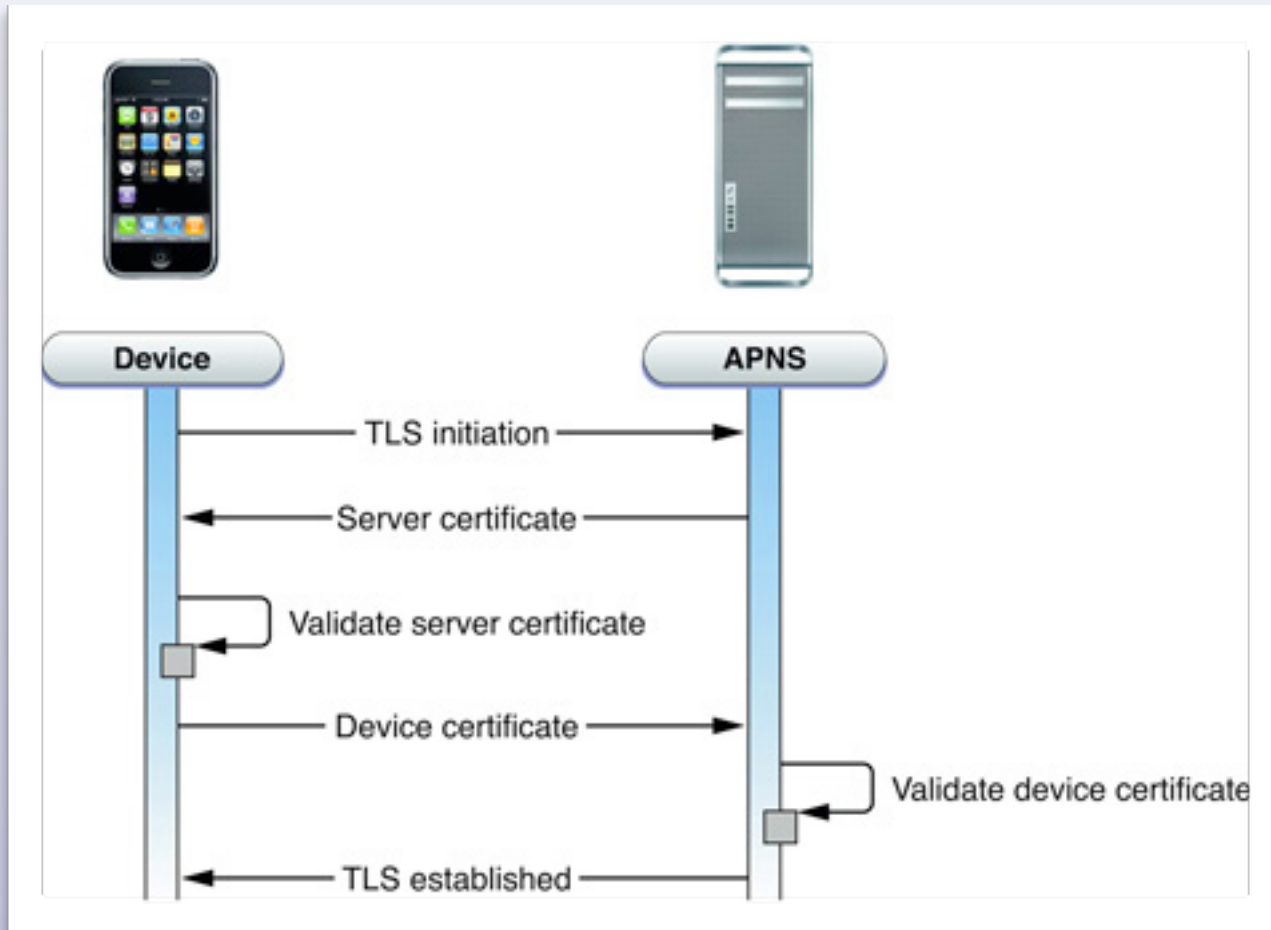

- 從 provider server 傳送訊息到手機

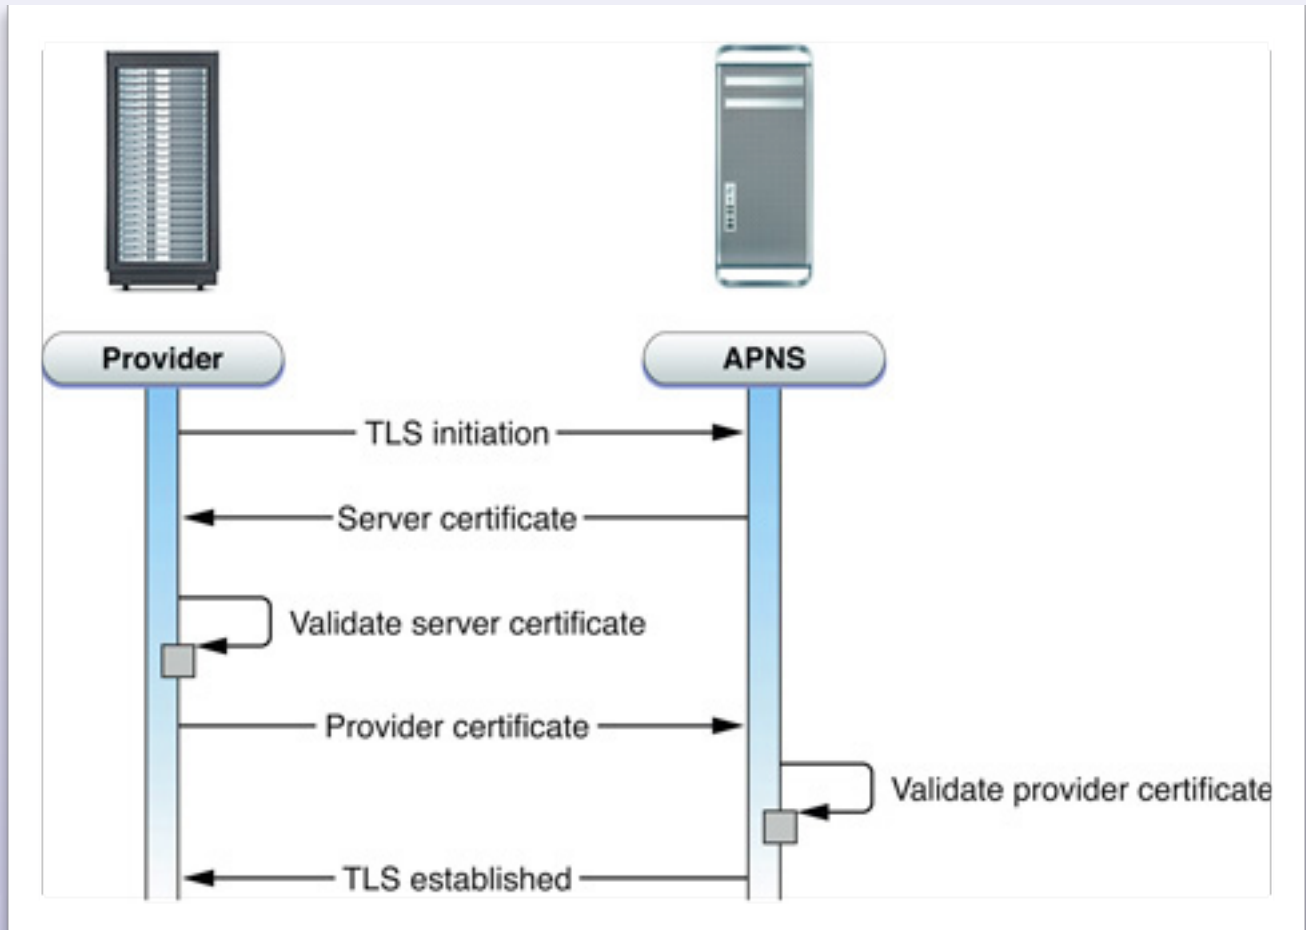

- APNs 的角色

# Push Notification 安全機制

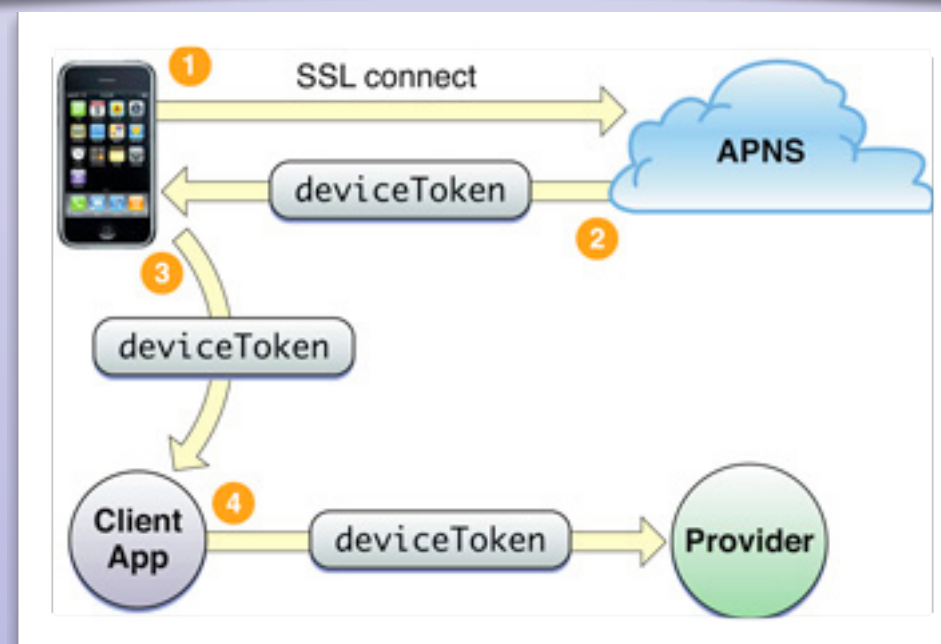

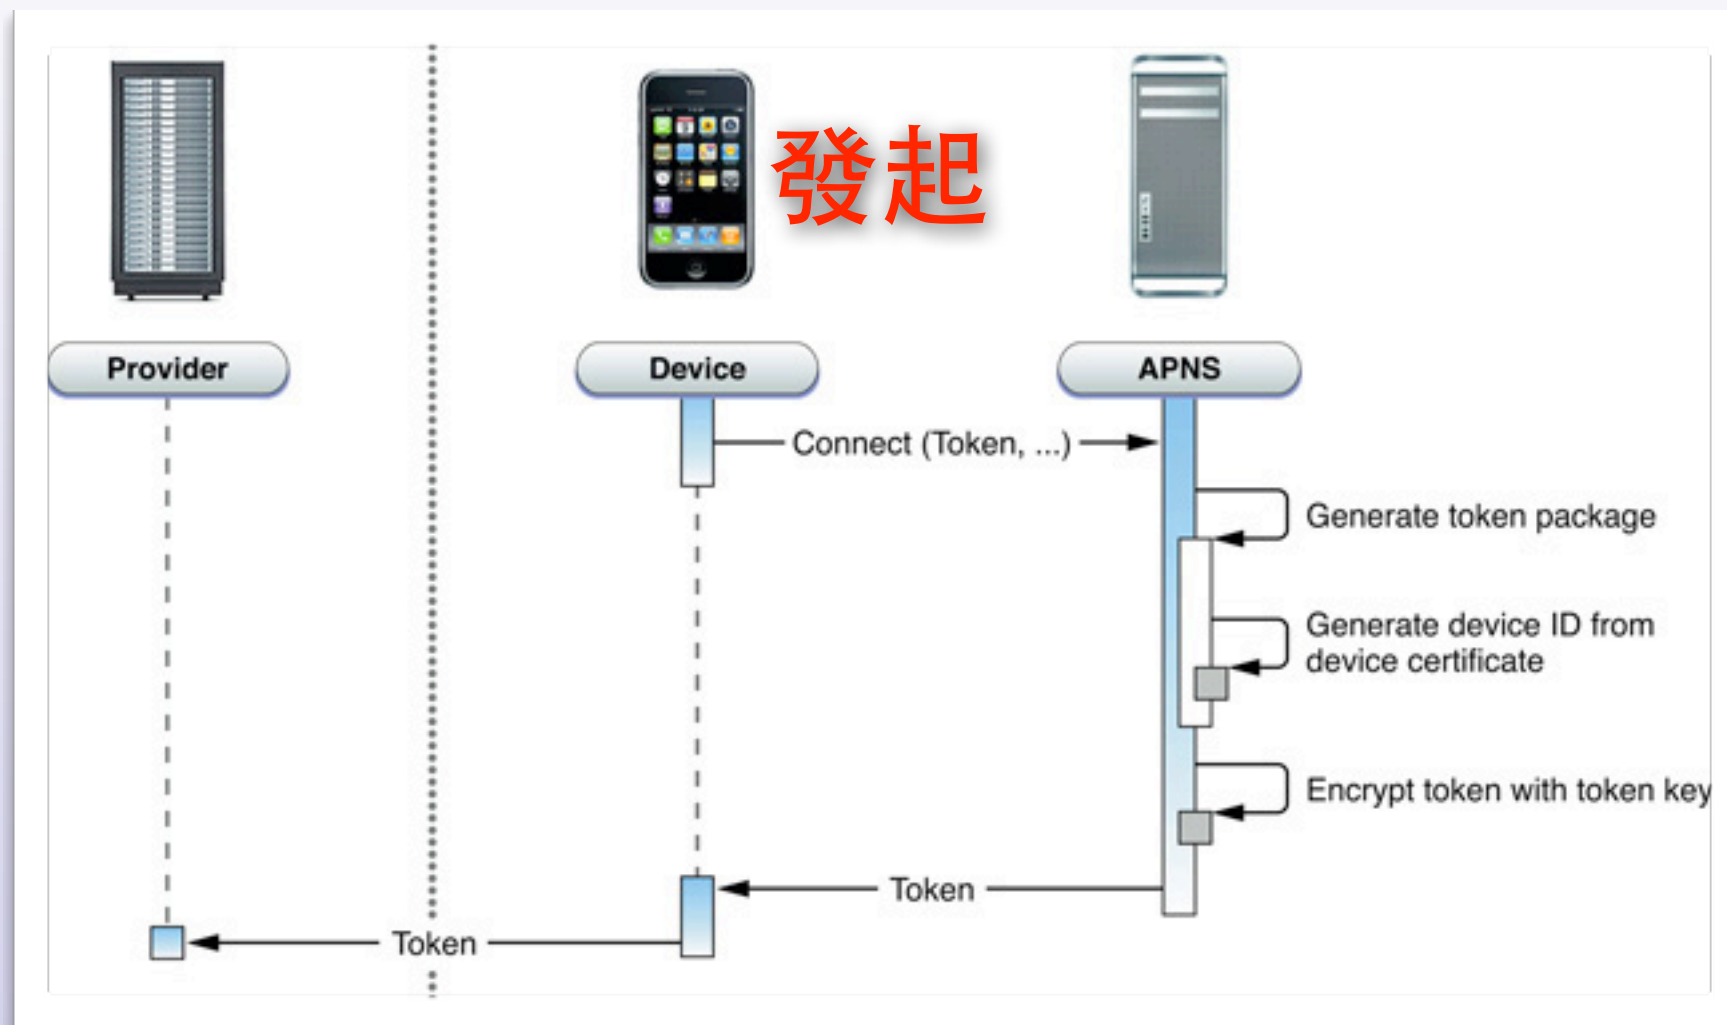

APNs 與手機的信任

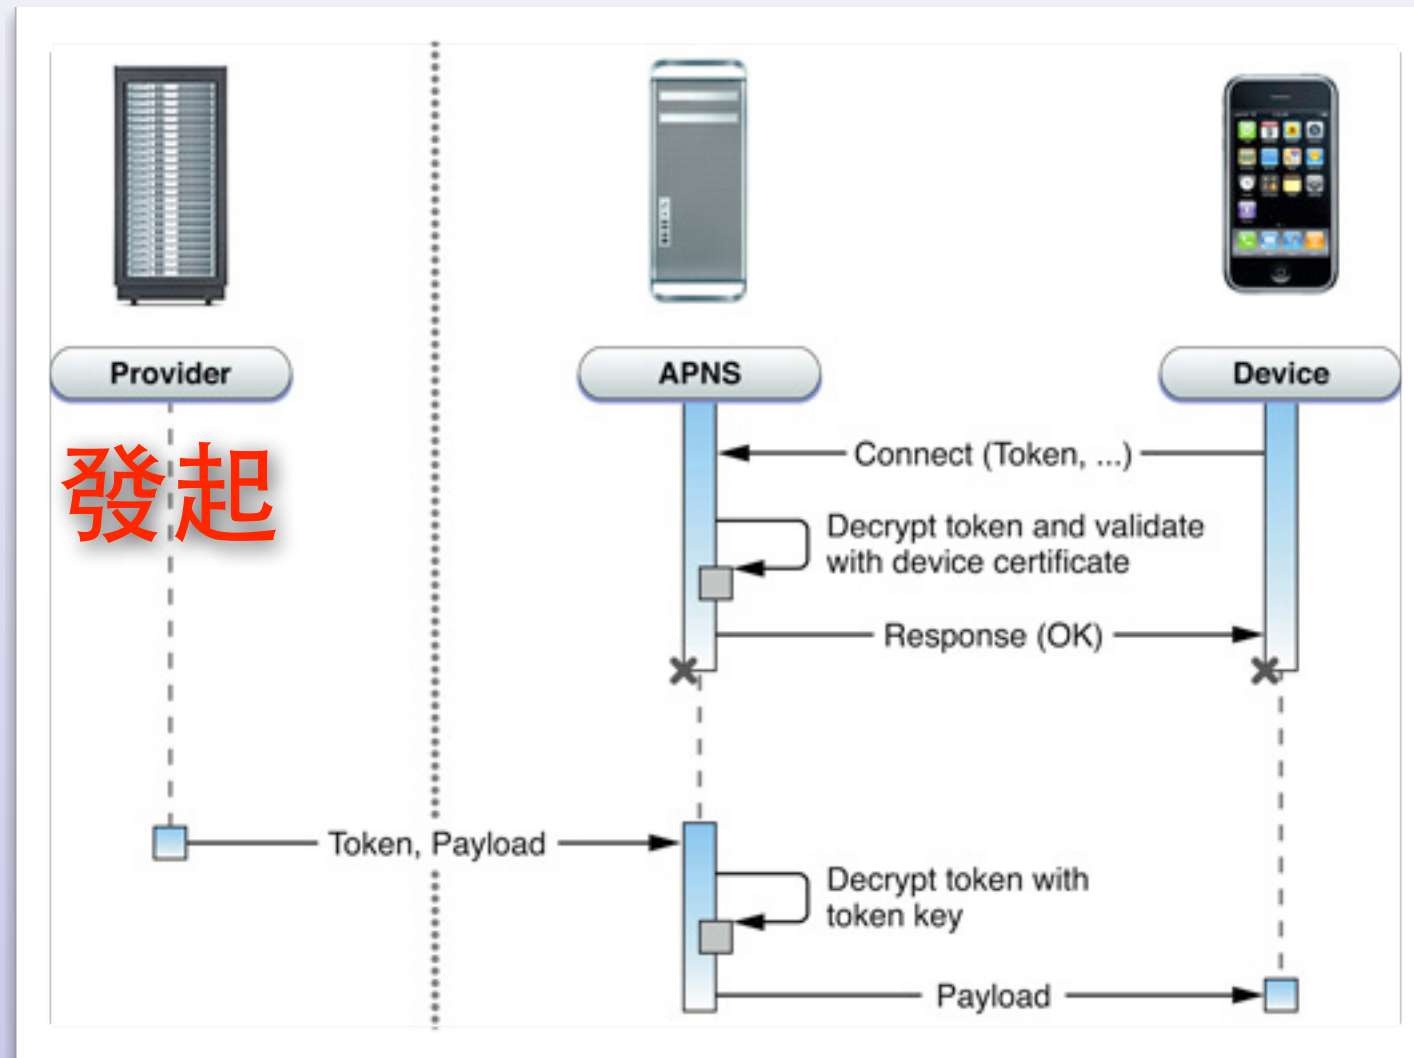

主機與 APNs 的信任

# Push Notification Token 產生與發佈

# 可信任的 Notification 傳遞

# Notification Payload

- 裝載如何提醒使用者的資訊與自訂的資料
- 最大容量 256 bytes
- 超過容量會被拒絕傳送
- 以 JSON dictionary object 組成
- 必須有 key:aps 的 dictionary，內容為：
  - alert
  - badge
  - sound

# aps dictionary

Key	Value type	Comment
alert	string or dictionary	<p>If this property is included, the system displays a standard alert. You may specify a string as the value of <code>alert</code> or a dictionary as its value. If you specify a string, it becomes the message text of an alert with two buttons: Close and View. If the user taps View, the application is launched.</p> <p>Alternatively, you can specify a dictionary as the value of <code>alert</code>. See <a href="#">Table 3-2</a> for descriptions of the keys of this dictionary.</p>
badge	number	<p>The number to display as the badge of the application icon.</p> <p>If this property is absent, the badge is not changed. To remove the badge, set the value of this property to 0.</p>
sound	string	<p>The name of a sound file in the application bundle. The sound in this file is played as an alert. If the sound file doesn't exist or <code>default</code> is specified as the value, the default alert sound is played. The audio must be in one of the audio data formats that are compatible with system sounds; see <a href="#">"Preparing Custom Alert Sounds"</a> for details.</p>

# alert property

Key	Value type	Comment
body	string	The text of the alert message.
action-loc-key	string or null	If a string is specified, the system displays an alert with two buttons, whose behavior is described in Table 3-1. The string is used as a key to get a localized string in the current localization to use for the right button's title instead of "View". If the value is <code>null</code> , the system displays an alert with a single OK button that simply dismisses the alert when tapped. See <a href="#">"Localized Formatted Strings"</a> for more information.
loc-key	string	A key to an alert-message string in a <code>Localizable.strings</code> file for the current localization (which is set by the user's language preference). The key string can be formatted with <code>%@</code> and <code>%n\$@</code> specifiers to take the variables specified in <code>loc-args</code> . See <a href="#">"Localized Formatted Strings"</a> for more information.
loc-args	array of strings	Variable string values to appear in place of the format specifiers in <code>loc-key</code> . See <a href="#">"Localized Formatted Strings"</a> for more information.
launch-image	string	The filename of an image file in the application bundle; it may include the extension or omit it. The image is used as the launch image when users tap the action button or move the action slider. If this property is not specified, the system either uses the previous snapshot, uses the image identified by the <code>UILaunchImageFile</code> key in the application's <code>Info.plist</code> file, or falls back to <code>Default.png</code> . This property was added in iOS 4.0.

# payload 範例

- alert

```
"alert" : {  
    "loc-key" : "GAME_PLAY_REQUEST_FORMAT",  
    "loc-args" : [ "Jenna", "Frank"]  
}
```

- Localizable.strings 內容

```
"GAME_PLAY_REQUEST_FORMAT" = "%@ and %@ have invited you to play  
Monopoly";
```

- 提醒出現

“Jenna and Frank have invited you to play Monopoly”

# 實作練習

## SSPush

# 產生 Provider 使用的證書

- 建立 應用程式 ID，App ID
- 建立 描述檔，Provisioning Profile

注意順序：先產生 App ID，要先啟用 APNS，再產生描述檔

## Registering an App ID

The App ID string contains two parts separated by a period (.)—an App ID Prefix that is defined as your Team ID by default and an App ID Suffix that is defined as a Bundle ID search string. Each part of an App ID has different and important uses for your app. [Learn More](#)

### App ID Description

Name:

You cannot use special characters such as @, &, \*, ', "

### App ID Prefix

Value:

## App ID Suffix

### ☒ **Explicit App ID**

If you plan to incorporate app services such as Game Center, In-App Purchase, Data Protection, and iCloud, or want a provisioning profile unique to a single app, you must register an explicit App ID for your app.

To create an explicit App ID, enter a unique string in the Bundle ID field. This string should match the Bundle ID of your app.

Bundle ID:

We recommend using a reverse-domain name style string (i.e., com.domainname.appname). It cannot contain an asterisk (\*).

### ☐ **Wildcard App ID**

This allows you to use a single App ID to match multiple apps. To create a wildcard App ID, enter an asterisk (\*) as the last digit in the Bundle ID field.

Bundle ID:

Example: com.domainname.\*

## App Services

Select the services you would like to enable in your app. You can edit your choices after this App ID has been registered.

- Enable Services:
- ☐ Data Protection
    - ☐ Complete Protection
    - ☐ Protected Unless Open
    - ☐ Protected Until First User Authentication
  - ☒ Game Center
  - ☐ iCloud
  - ☒ In-App Purchase
  - ☐ Inter-App Audio
  - ☐ Passbook
  - ☒ Push Notifications

Cancel

Continue

## Confirm your App ID.

To complete the registration of this App ID, make sure your App ID information is correct, and click the submit button.

Provider

# 建立 Provider 與 APNS 信任

- 開啟 Terminal

- 產生 PEM 格式檔案

```
openssl pkcs12 -clcerts -nokeys -out apns-cert.pem -in apns-cert.p12
```

```
openssl pkcs12 -nocerts -out apns-key.pem -in apns-key.p12
```

```
openssl rsa -in apns-key.pem -out apns-key-noenc.pem
```

- 合併成發佈用的 PEM 檔案 **apns-dev.pem**

```
cat apns-cert.pem apns-key-noenc.pem > apns-dev.pem
```

- 試看看可不可連結

```
telnet gateway.sandbox.push.apple.com 2195
```

- 試看看憑證與密鑰可不可連結

```
openssl s_client -connect gateway.sandbox.push.apple.com:  
2195 -cert apns-cert.pem -key apns-key.pem
```

Cancel Previous Next

- 向 APNS 註冊

application:didFinishLaunchingWithOptions:

```
[[UIApplication sharedApplication]
 registerForRemoteNotificationTypes:
 (UIRemoteNotificationTypeBadge |
  UIRemoteNotificationTypeSound |
  UIRemoteNotificationTypeAlert)];
```

- 取得 device token

application:didRegisterForRemoteNotificationsWithDeviceToken:

```
NSString* newToken = [deviceToken description];
```

```
newToken = [newToken stringByTrimmingCharactersInSet:[NSCharacterSet
 characterSetWithCharactersInString:@"<>"]];
```

```
newToken = [newToken stringByReplacingOccurrencesOfString:@" "
 withString:@""];
```

- `-(void)application:(UIApplication *)application  
didRegisterForRemoteNotificationsWithDeviceToken:  
(NSData *)deviceToken`  
向 **APNS** 註冊成功，回傳 **deviceToken**
- `-(void)application:(UIApplication *)application  
didFailToRegisterForRemoteNotificationsWithError:  
(NSError *)error`  
無法向 **APNS** 註冊
- `-(void)application:(UIApplication *)application  
didReceiveRemoteNotification:  
(NSDictionary *)userInfo`  
**App** 執行時，收到 **remote notification**

# 主機端 PHP Provider: SimplePush

- 以 SimplePush.php 檢測
- 加入 apns-dev.pem
- 從 Terminal 執行  
php simplepush.php
- 正常會回應  
Connected to APNS  
Message successfully delivered
- iPhone 收到通知

# Notification Center

# 建立分派表

- 每個 App 程式都會有一組內定通知中心 `NSNotificationCenter` object，不用額外建立
- 登記觀察分派表方法

`addObserver:selector:name:object:`

`addObserverForName:object:queue:usingBlock:`

- 從觀察分派表取消方法

`removeObserver:`

- 取用與呼叫方法

`postNotificationName:object:`

# NSNotificationCenter

- 應用在實體類別間的呼叫
- 負責接收的實體類別，先向系統註冊通知  
通常在 `-(void)viewDidLoad`  

```
[[NSNotificationCenter defaultCenter] addObserver:self  
selector:@selector(refreshTable:)  
name:@"RefreshTableNotification" object:nil];
```
- 加上處理程序於 `refreshTable:`  
`-(void)refreshTable:(NSNotification *)notification`
- 記得在實體類別要註銷系統通知。  
通常在 `-(void)didReceiveMemoryWarning` 與 `-(void)viewDidUnload(iOS 6 不用)`  

```
[[NSNotificationCenter defaultCenter] removeObserver:self]
```
- 呼叫者只要向系統發出通知即可  

```
[[NSNotificationCenter defaultCenter]  
postNotificationName:@"RefreshTableNotification" object:nil];
```
